WHAT ENHANCES LEARNING PROCESSES BETWEEN POLICY- MAKERS AND SCIENTISTS REGARDING COASTAL RISKS?

How do policy-makers interact with scientists and receive scientific information regarding coastal risks, and how do they take into account the needs of the general population? How are risk reduction policies drafted and communicated to the general population? The central research question of my interdisciplinary research is: What enhances learning processes between policy-makers and scientists? I am addressing the complex question of decision-making by carrying out fieldwork in Morocco and Italy.

After his Master's thesis in physical oceanography at the University of Zagreb, Croatia, and a master's thesis in the marine environment at Aix-Marseille University in France, Ante Ivčević got his PhD in geography in Marseille in 2020. He worked as a programme officer for PAP/RAC - the regional centre of the UN Environment Programme - Mediterranean Action Plan in coastal management in 2021. From 2022, he is a postdoctoral researcher at Vrije Universiteit Brussel, Belgium and his research is in the field of risk governance and coastal risk management.
